2.	INDEPENDENT CLAIM 1
2.1	Document D1 is considered the prior art closest to the subject matter of claim 1 and discloses (the references between parentheses refer to that document): a casing (S) for transporting a toner mixture on its outer surface in a developing device, the casing wall consisting of aluminium and the outer surface of the casing (S) being provided with a nickel-copper-phosphorus intermediate layer (P ₁) produced by chemical

deposition and an outer chromium layer (P₂) produced by electroplating (see paragraphs [0022]-[0027]).

(Document D1 also indicates (see paragraph [0074]) that if a nickel-phosphorus layer is used as second layer, the chromium layer may also be dispensed with. A roll with a nickel-copper-phosphorus outer layer is therefore not known from D1.)

The subject matter of claim 1 thus differs from the prior art known from document D1 in that an outer nickel-copper-phosphorus layer is provided which contains 1 to 2 % copper and 8 to 10 % phosphorus.

The subject matter of claim 1 is thus novel (PCT Article 33(2)).

- 2.2 The current invention can therefore be considered to address the problem of devising a casing for transporting a toner mixture, favourable electromagnetic and mechanical properties being achieved for the functioning of the casing.

The solution to this problem as proposed in claim 1 of the present application involves an inventive step (PCT Article 33(3)) for the following reasons:

The problem is solved, in particular, in that the

casing has an outer layer of nickel and copper, with 1 to 2 % copper and 8 to 10 % phosphorus, which results in sufficient electrical conductivity with only a very slight influence on electromagnetic properties. Many materials with similar electrical properties are known for forming the outer layer of this type of casing. However, in contrast to the claimed layer, said materials have a negative influence on electromagnetic properties, in particular by residual magnetisation of the layers. The claimed layer prevents such a negative influence on the electromagnetic properties. The formation of the magnetic field on the surface of the casing is considerably improved by the chosen material combination in relation to casings known from the prior art. In particular, the electromagnetic properties of the casing are improved in relation to a casing with an outer nickel-phosphorus layer, such as is known from document D1.

None of the cited documents (D1-D3) discloses the link between electrical conductivity, magnetic properties and layer hardness on the one hand and the alloying ratios of the layer for copper and phosphorus on the other hand. Consequently, the claimed layer is neither disclosed nor suggested by the prior art.

The subject matter of the current claim 1 is thus novel and also involves an inventive step.
